PICOSECOND LASER TECHNOLOGY

## WHAT IS ENLIGHTEN?

enlighten is the most advanced laser system for gentle, effective and quick improvement in the appearance of unwanted freckles, sun spots, and age spots—enlighten treatments will make your skin appear lighter, brighter, and more even.

## HOW DOES AN ENLIGHTEN TREATMENT WORK?

The brown spots on your skin contain excess melanin. Melanin is what gives all of us color in our skin, but when it occurs in high concentrations, it can result in undesirable brown spots and uneven skin tone. When the laser light from enlighten is used to treat the brown spots, the melanin absorbs the laser light causing it to break into tiny particles which are then sloughed off or absorbed into the body.

## HOW MANY TREATMENTS SESSIONS ARE REQUIRED?

A series of two to three enlighten treatments are recommended to achieve an optimal outcome, and ongoing maintenance treatments are encouraged to sustain results over time. Your enlighten treatment provider will discuss a treatment plan during your consultation.

## WHAT AREAS CAN BE TREATED?

enlighten is an ideal treatment for the face, hands and other areas of the body with noticeable signs of sun damage and pigmentation.

## WHAT CAN I EXPECT DURING AN ENLIGHTEN TREATMENT AND WHAT DOES IT FEEL LIKE?

Prior to treatment, your provider will clean the area. You will feel the tip of the laser device touch your skin. When the laser is firing, patients compare the procedure to a rubber band being snapped against their skin. Most patients do not find the treatment uncomfortable, but if you do, your treatment provider may apply a topical anaesthetic. Immediately after treatment, you may apply cold air or an ice pack for a short time. You should keep the treated area out of the sun and/or apply sunscreen for protection. Your treatment provider may recommend additional follow-up care.

## WHAT ARE THE POSSIBLE SIDE EFFECTS?

Most patients experience mild redness and swelling immediately following the treatment. These side effects are temporary and typically resolve in several hours. In a few days, the pigment will appear darker. This is also temporary and is a sign the treatment is working. The darker spots will appear to flake off over a few days.

## IS THERE ANY DOWNTIME ASSOCIATED WITH THE TREATMENT?

Although patients may experience mild redness and swelling for a few hours, patients can return to regular activities immediately following the treatment.
